

ABSTRACT OF THE DISCLOSURE

In a threading control system for performing a threading
5 operation by moving, in synchronization with rotation of the
main-spindle, either a cutter or a workpiece in the feeding spindle
direction so that the ridge is not damaged nor the dimensional
accuracy of the thread is lowered even if the main-spindle speed is
variable, a threading computing section 3 and a main-spindle angle
10 computing section 4 are provided to alter the threading start timing
based on the servo-spindle acceleration time-constant of the
feeding spindle.
